## AC-Feasibility on Tree Networks is NP-Hard

Karsten Lehmann, Alban Grastien, and Pascal Van Hentenryck

**Abstract**—Recent years have witnessed significant interest in convex relaxations of the power flows, with several papers showing that the second-order cone relaxation is tight for tree networks under various conditions on loads or voltages. This paper shows that ac-feasibility, i.e., to find whether some generator dispatch can satisfy a given demand, is NP-hard for tree networks.

**Index Terms**—Computational complexity, optimal power flow (OPF).

### NOMENCLATURE

$\mathcal{N}$	AC-network.
$N$	Set of buses.
$N_G$	Set of generators.
$N_L$	Set of loads.
$i$	Bus of a network.
$j$	Bus of a network.

### I. INTRODUCTION

**M**ANY interesting applications in power systems, including optimal power flows, optimize an objective function over the steady-state power flow equations, which are nonlinear and nonconvex. These applications typically include an *ac-feasibility* (AC-FEAS) subproblem: find whether some generator dispatch can satisfy a given demand.

Although the set of ac-feasible solutions is in general a nonconvex set, this does not imply that the ac-feasibility problem is NP-hard,<sup>1</sup> as nonconvexity does not imply NP-hardness. For example, the family of optimization problems  $\min y$  such that  $0 \leq y \leq \prod_{i=1}^n x_i$  where  $n \in \mathbb{N}$  has a nonconvex constraint and a nonconvex solution set but the optimal solution is always  $y = 0$  and can be trivially computed.

The first NP-hardness proof for ac-feasibility was given for a cyclic network structure in [1]. It relies on a variant of the dc model [2] but uses a sine function around the phase angle dif-

## Abstract

In recent years the power systems research community has seen an explosion of work applying operations research techniques to challenging power network optimization problems. Regardless of the application under consideration, all of these works rely on power system test cases for evaluation and validation. However, many of the well established power system test cases were developed as far back as the 1960s with the aim of testing AC power flow algorithms. It is unclear if these power flow test cases are suitable for power system optimization studies. This report surveys all of the publicly available AC transmission system test cases, to the best of our knowledge, and assess their suitability for optimization tasks. It finds that many of the traditional test cases are missing key network operation constraints, such as line thermal limits and generator capability curves. To incorporate these missing constraints, data driven models are developed from a variety of publicly available data sources. The resulting extended test cases form a compressive archive, NESTA, for the evaluation and validation of power system optimization algorithms.

Insights!

UNCLASSIFIED

# Brute Force R&D Lessons Learned

- **Reproducing previous works is challenging**
  - working from a base implementation is very helpful

UNCLASSIFIED

# Brute Force R&D Lessons Learned

- **Reproducing previous works is challenging**
  - working from a base implementation is very helpful
- **AMPL was not built for this...**
  - limited means to avoid excessive code replication
  - really hard to automate from the command line
  - limited licenses was the bottle neck in the All Formulations by All Instances Experiment

UNCLASSIFIED

# The Matpower Effect

- If a formulation is not implemented in Matpower, it **does not exist**
- At least for the majority of Power System PhD students

UNCLASSIFIED

# Inception of PowerModels.jl

- A **baseline implementation** of Power Flow formulations from the literature
  - Hopefully, mitigates the Matpower effect

UNCLASSIFIED

# Inception of PowerModels.jl

- A **baseline implementation** of Power Flow formulations from the literature
  - Hopefully, mitigates the Matpower effect
- **Using Julia/JuMP** Resolves the AMPL Issues
  - Easy to automate at the command line
  - Fully open-source makes large-scale experiments easy
  - Julia enables advanced software design

UNCLASSIFIED

# My Dream

- I learn about a newly **proposed Power Flow** formulation
- It is **implemented** in **PowerModels.jl** and tested on all started test cases, in **7 days or less**

UNCLASSIFIED

# My Dream

- I learn about a newly **proposed Power Flow** formulation
- It is **implemented** in **PowerModels.jl** and tested on all started test cases, **in 7 days or less**
- Lots of **code abstractions** in **PowerModels.jl** to enable this

# Versions Past and Planned

- **v0.1.0** (2016 Q2-Q3)
  - First draft (basically learning Julia / JuMP)
- **v0.2.0** (2016 Q3-Q4)
  - First public version, Thanks to Miles
- **v0.3.0** (2017 Q1-**Present**)
  - Significant engineering improvements
